

MikroTik Router Setup

In 3 simple steps

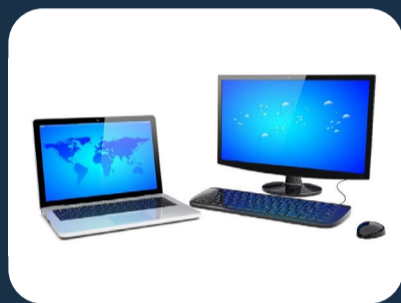

MikroTik routers are very popular because of their **flexibility** and **easy** configuration. They're perfect for Social WiFi type networks as you can configure the Social WiFi hotspot **directly** on it and place it anywhere within the network infrastructure. This router will also broadcast the network to all the other access points (even ones not compatible with Social WiFi). And they're **extremely good value for money** compared to comparable products.

What do you need?

MikroTik Router

Computer
(PC or laptop)

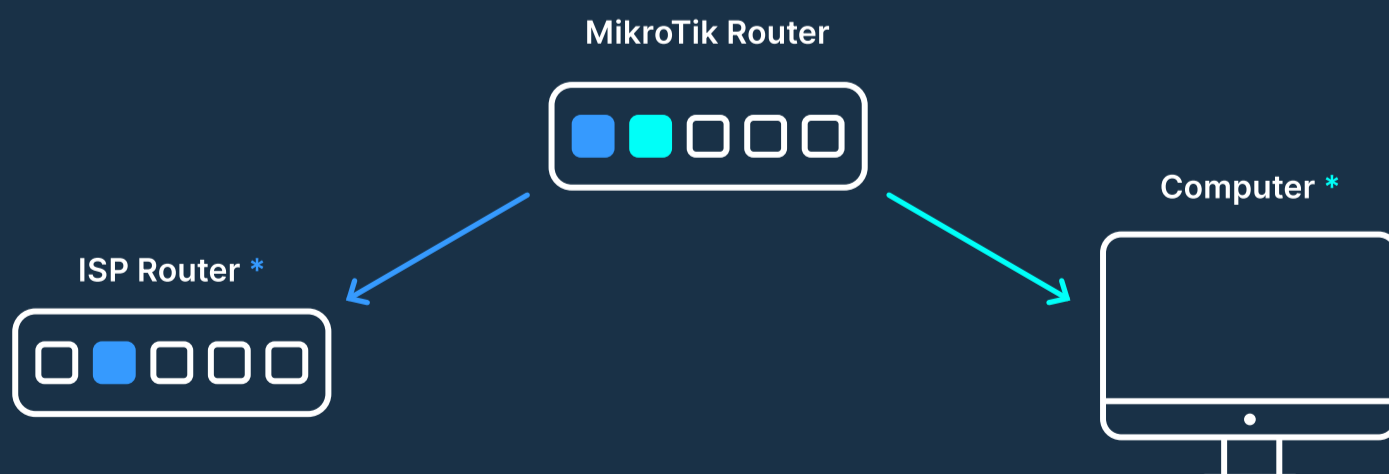

3x ethernet cables

Ethernet Adapter
(depends on device)

- 1 Connect MikroTik to both ISP router and computer**
(ETH 1 to ISP, ETH 2 to Computer)
- 2 Run configuration**
- 3 Disconnect from computer and test**

* Most ISP routers already have a port dedicated to a direct Internet connection, so it must remain unused. If we want to provide Internet access to any external device, we need to use all the other available ports.

* Use an adapter if you do not have a suitable input on your computer.
